Hörmann builds wallboxes with ELAM

HÖRMANN Automotive GmbH consists of six high-performance companies with decades of experience in the development, production, assembly and logistics of components for the automotive industry. The business at HÖRMANN Automotive is divided into three strategic business areas: Truck, Off-Road and E-Mobility. In the E-Mobility segment, Hörmann Automotive was able to win a new customer with the production of wallboxes.

The project

For these new products, the end customer has specified our ELAM assistance system as a mandatory software. The wallboxes are now assembled with ELAM at four stations, then tested at two stations and finally packed. Since wallboxes are a very complex product, the employees sometimes have to do more than 200 work steps at the different stations. While the quantities were still very low at the beginning, they have risen sharply in a short time. Thanks to the ELAM system, the processes are safely managed right from the start and monitored with the help of scanners, screwdrivers and label printers.

The goal

Thanks to the ELAM system, Hörmann Automotive meets the high quality requirements of the end customer. Since June, around 250-300 charging stations per month have been leaving the factory without any faults - trend is rising! This exciting project has made Hörmann Automotive an enthusiastic ELAM customer.

"We are so convinced by the ELAM system, that we will equip the assembly of other product lines for upcoming orders with the ELAM system as well." This has since been backed up by placed orders.
